While wind turbines capture nature's power, they can't store it – until now. You're witnessing a transformation in renewable energy as storage solutions reshape wind power's potential. Modern wind farms are combining batteries, supercapacitors, and emerging technologies to solve their biggest.

The simulation showed that 100 MW electricity could be generated from the wind sources with respect to the available data via global wind metrological data, literature, RETScreen Expert software., LCOE and IRR analysis tools. In addition, the Internal rate of return (IRR) of 8.7% which is good.

Growing levels of wind and solar power increase the need for flexibility and grid services across different time scales in the power system. There are many sources of flexibility and grid services: energy storage is a particularly versatile one. Various types of energy storage technologies exist.

Enter the 100MW supercapacitor energy storage systems – the Usain Bolt of energy storage that delivers explosive power in seconds. While lithium-ion batteries get most media love, these silent performers are rewriting the rules of grid-scale energy solutions. Let's unpack why engineers are calling.

As renewable energy capacity surges globally – solar and wind installations grew 18% year-over-year in Q1 2025 – the need for utility-scale energy storage has never been greater. But here's the rub: While everyone talks about battery chemistry and power ratings, the elephant in the control room.
