

# Desulfurization and denitrification in solar glass factories

## Overview

---

By combining desulfurization (removing sulfur oxides like SO<sub>2</sub>) and denitrification (reducing nitrogen oxides like NO<sub>x</sub>), they provide a holistic solution that minimizes environmental impact while maximizing operational efficiency.

By combining desulfurization (removing sulfur oxides like SO<sub>2</sub>) and denitrification (reducing nitrogen oxides like NO<sub>x</sub>), they provide a holistic solution that minimizes environmental impact while maximizing operational efficiency.

Integrated desulfurization and denitrification systems represent a cutting-edge approach to addressing multiple pollutants simultaneously, offering a sustainable alternative to traditional methods. These systems are designed to handle complex emissions from various sources, including industrial.

Keywords: glass furnace; flue gas simultaneous desulfurization and denitration; analysis  
Abstract: In this paper, according to the flue gas characteristics of glass melting furnace, combined with the existing glass melting furnace flue gas desulfurization and denitrification process. The analysis and.

Desulfurization refers to the removal of sulfur dioxide (SO<sub>2</sub>) from flue gas, which is a common byproduct of burning fossil fuels. Various methods are employed to achieve effective desulfurization, including wet, dry, and semi-dry techniques. Wet desulfurization, especially the lime-gypsum method.

A dielectric barrier discharge (DBD) reactor combined with a wet scrubbing tower was used to carry out an experimental study on desulfurization and denitrification. The effects of the packing type, packing height, spray density, mass fraction of the NaOH solution, discharge power in the DBD.

Integrated desulfurization and denitrification systems have emerged as a cornerstone technology, combining multiple processes to tackle pollutants like SO<sub>2</sub>, NO<sub>x</sub>, and particulate matter in a single, streamlined unit. These systems are particularly vital for industries such as glass manufacturing.

## Desulfurization and denitrification in solar glass factories

### Simultaneous Desulfurization and Denitrification by H<sub>2</sub>O<sub>2</sub>/FeSO<sub>4</sub>

This study focused on the development of a novel process of H<sub>2</sub>O<sub>2</sub>/FeSO<sub>4</sub> preoxidation combined with wet flue gas desulfurization (WFGD) postabsorption for ...
