

How high should the outdoor wireless AP base station be installed

Overview

Keep APs within recommended mounting heights: (20–30 feet, ideally under 40 feet) to avoid weakened signal strength. Anticipate interference from lighting, HVAC systems, and conduits. Consider acoustic panels that may scatter or absorb RF signals.

Keep APs within recommended mounting heights: (20–30 feet, ideally under 40 feet) to avoid weakened signal strength. Anticipate interference from lighting, HVAC systems, and conduits. Consider acoustic panels that may scatter or absorb RF signals.

This article describes the best practices for mounting outdoor access points (APs). For full installation instructions, read the B350 Outdoor Access Point Installation Guide. Most defective access point claims are from water damage caused by missing drip loop or lighting strikes caused by improper.

Indoor APs can be installed on walls, ceilings, T-rails, U-rails, desks, into ceilings, or embedded into 86-type boxes. The recommended installation height is from 3 m to 4 m. Outdoor APs can be installed on walls and poles. The recommended installation height is 4 m to 6 m for omnidirectional.

Outdoor access points play a vital role in expanding your wireless network over larger distances, offering reliable and high-performance connectivity in areas such as campuses, parks, or outdoor event venues. By deploying these access points, you can reduce costs on infrastructure and wiring.

For a room with a ceiling height of 20 feet, it is recommended to install the access points (APs) on the ceiling. This is because the signal strength of the APs is stronger when they are installed on the ceiling than on the wall. The APs should be installed at a height of 10-12 feet from the floor.

Excerpt from doc: The access points can be installed at any height, but best throughput is achieved when all the access points are mounted at the same height. We recommend installing the access points no higher than 40 feet to allow support for wireless clients on the ground.

This Solutions Guide will introduce the various ways to expand your indoor network

to outdoor spaces, including a backyard, a remote barn or guest house, a dock or yacht club, campgrounds, and other large outdoor areas. Depending on how far from the house or building you want to extend your.
