

Nuku alofa BMS battery management control system architecture

Overview

What is a BMS master controller?

Data is sent to a BMS Master Controller, which aggregates and analyzes the information. Battery Management Unit (BMU): The Battery Management Unit (BMU) is a key component in a Battery Management System (BMS) responsible for monitoring and measuring critical parameters of the entire battery pack or its individual cells.

What is a battery management system (BMS)?

The BMS monitors and controls the state of the battery to prevent issues such as overcharging, over-discharging, and overheating. Based on the provided block diagram, we will walk through the essential components and functions of a typical BMS architecture used in EVs, referencing each major block from the image.

What is a battery management controller (BMC)?

2. Battery Management Controller (BMC) At the core of the BMS is the Battery Management Controller (BMC), which processes data from sensors and takes appropriate actions. The BMC is responsible for controlling the charging and discharging cycles of the battery, cell balancing, and overall system diagnostics.

How does a BMS protect a battery?

Protection The BMS enforces safe operating limits. It prevents overcharge, deep discharge, overcurrent, and overheating. In extreme cases, it can disconnect the battery entirely via MOSFETs or contactors. Multiple protection layers ensure that even if one fails, others remain active to keep the system safe.
